

BCS2213 – Formal methods

Teaching assignment 1. Z specification of BirthdayBook.

1. Run CZT-IDE.

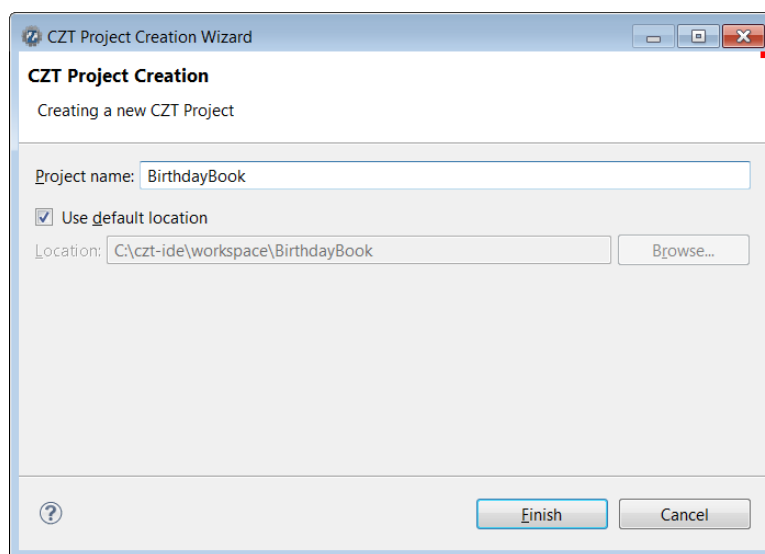

The Community Z Tools (CZT) is a set of tools for editing and typechecking formal specifications written in Z specification language.

Note, if CZT-IDE is not installed on your PC you may download it from

<http://sourceforge.net/projects/czt/files/czt-ide/2.0-pre1/>

2. Creating a CZT project.

Create a new CZT project by selecting **File > New > Project > CZT > CZT Project** in the menu.

- Enter the name of the new project.

Note: you can create CZT project in your existing directories: just specify an existing directory in the Location field. The name does not have to match the directory.

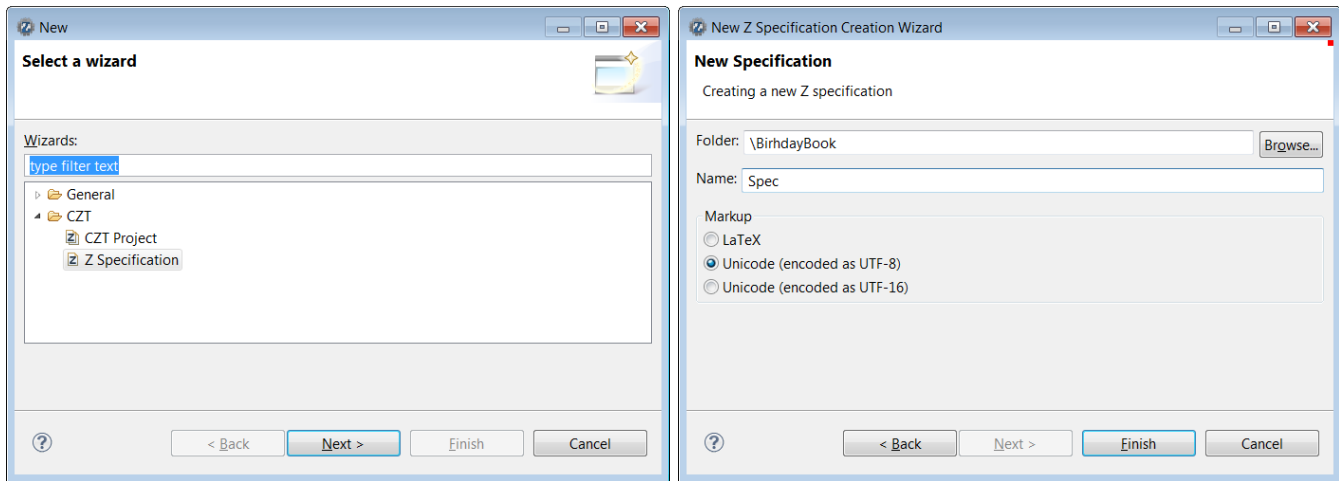

- If the **Z perspective** is not active at the moment, the wizard will ask you whether you want to open the Z perspective. It is highly recommended that you open it because it will automatically open a set of Eclipse views useful for Z development.
- The new project will be created and selected in the workbench window.

3. Creating Z specification.

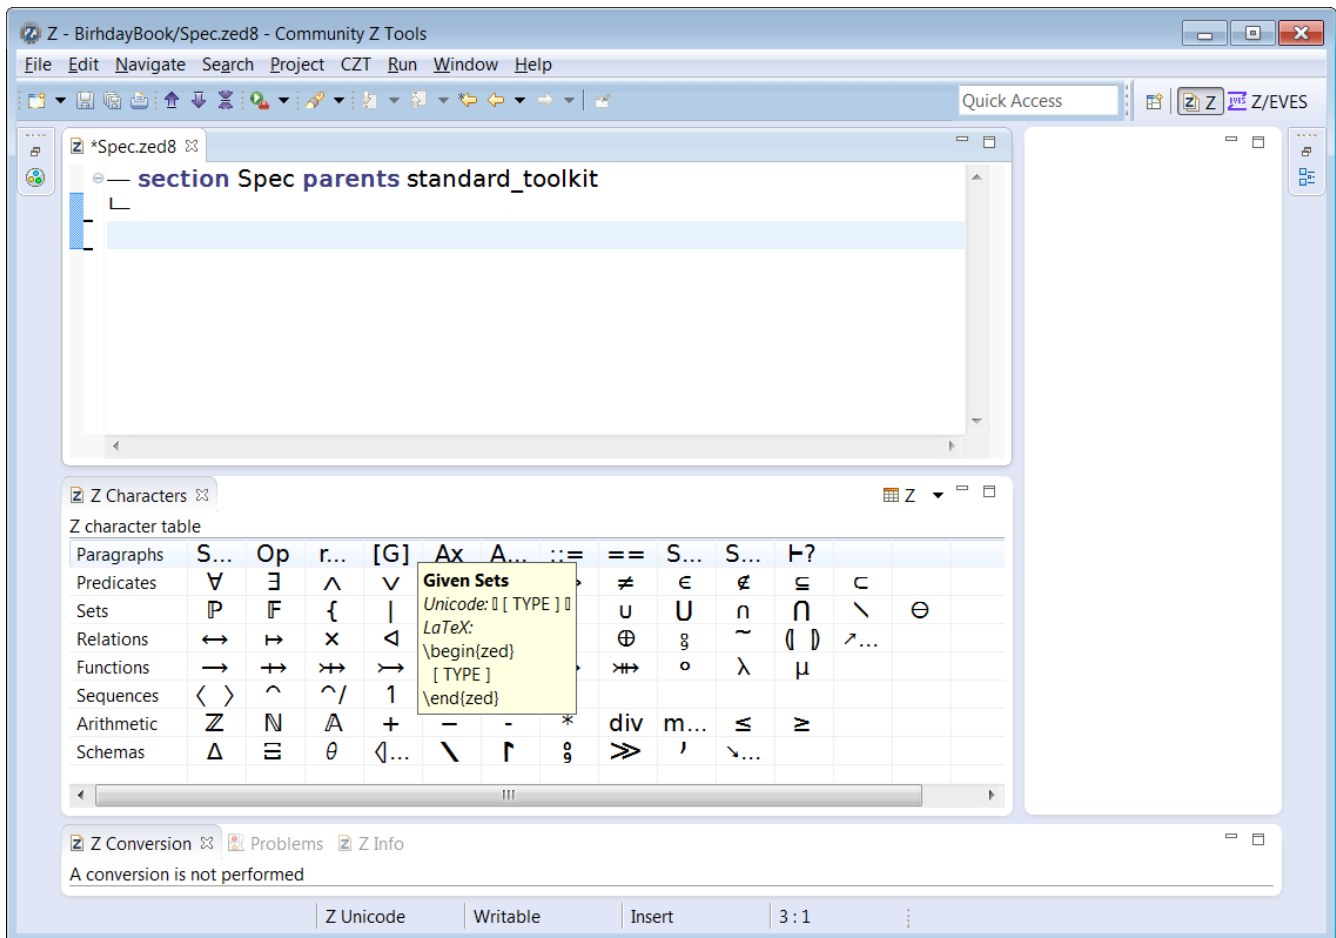

The CZT editor plug-in provides a wizard to create a new Z specification. The wizard can be opened using the menu entry **File > New > Other... > CZT > Z Specification**.

- In this wizard, enter the name of the new Z specification (please use Lab_1_<your ID> for the name) and folder (\BirthdayBook).
- As the Z specification can be written using LaTeX or Unicode, you need specify a markup for the new specification. Choose Unicode (UTF 8) markup.

- The name of the new specification will be the name you specified appended by the extension corresponding to the selected markup.

- Then the new specification will be created and opened in the workbench window.

- Develop Z specification of BirthdayBook for recording people's birthdays.
- First, define [NAME, DATE] as the basic types of the specification.
For it, find in Z character table the [G] cell (Given Sets) and press it (see the figure above).

6. Flowing given below description, develop *BirthdayBook* schema.

<i>BirthdayBook</i>
<i>known</i> : $\mathbb{P} \text{ NAME}$
<i>birthday</i> : $\text{NAME} \rightarrow \text{DATE}$
<i>known</i> = dom <i>birthday</i>

To do it, find in the Z character table the Sch (Schema Definition) template and insert it into your specification.

Paragraphs	S...	Op	r...	[G]	Ax	A...	::=	=	S...	S	⊢?
Predicates	\forall	\exists	\wedge	\vee	\neg	\Rightarrow	\Leftrightarrow	\neq	\in	Schema Definition Unicode: NAME DECLS PREDS LaTeX: $\backslash\text{begin}\{\text{schema}\}\{\text{NAME}\}$ DECLS \where PREDS $\backslash\text{end}\{\text{schema}\}$	
Sets	\mathbb{P}	\mathbb{F}	$\{$	$ $	\bullet	$\}$	\emptyset	\cup	\mathbb{U}		
Relations	\leftrightarrow	\mapsto	\times	\triangleleft	\triangleleft	\triangleright	\triangleright	\oplus	\otimes		
Functions	\rightarrow	\mapsto	\mapsto	\mapsto	\mapsto	\mapsto	\mapsto	\mapsto	\circ		
Sequences	$\langle \rangle$	\wedge	\wedge	1	\uparrow	$\#$					
Arithmetic	\mathbb{Z}	\mathbb{N}	\mathbb{A}	$+$	$-$	$-$	$*$	div	$m..$		
Schemas	Δ	Ξ	θ	$\langle \dots$	\backslash	\uparrow	\otimes	\gg	m..		

As result, at this stage your Z specification should looks like

Spec.zed8
<pre> section Spec parents standard_toolkit └ [NAME, DATE] └ This specification describes ... └ BirthdayBook known : P NAME birthday : NAME → DATE known = dom birthday └ </pre>

Please insert showing your understanding comments inside Z specification. Note, CZT-IDE consider as comments any text, placed outside of the schemas (see e.g. “**This specification describes ...**” in above figure).

7. Specify Dynamic Aspects of the schema by AddBirthday operation.

AddBirthday

$\Delta BirthdayBook$

$name? : NAME$

$date? : DATE$

$name? \notin known$

$birthday' = birthday \cup \{name? \mapsto date?\}$

8. Add FindBirthday operation.

FindBirthday

$\exists BirthdayBook$

$name? : NAME$

$date! : DATE$

$name? \in known$

$date! = birthday(name?)$

9. Add Remind operation.

Remind

$\exists BirthdayBook$

$today? : DATE$

$cards! : \mathbb{P} NAME$

$cards! = \{n : known \mid birthday(n) = today?\}$

10. Describe the *initial state* of the system.

InitBirthdayBook

BirthdayBook

$known = \emptyset$

11. Strengthening *AddBirthday*

Define the type *REPORT* ::= *ok* | *already_known* / *not_known* (use the *freetype* definition symbol)

12. Define *Success* and *AlreadyKnown* schemas

Success

result! : *REPORT*

result! = *ok*

AlreadyKnown

\exists *BirthdayBook*

name? : *NAME*

result! : *REPORT*

name? \in *known*

result! = *already_known*

13. Combine schemas *Success* and *AlreadyKnown*

RAddBirthday \triangleq

$(\textit{AddBirthday} \wedge \textit{Success}) \vee \textit{AlreadyKnown}$

14. Define the schema *NotKnown*

NotKnown

\exists *BirthdayBook*

name? : *NAME*

result! : *REPORT*

name? \notin *known*

result! = *not_known*

15. Combine the schemas

RRemind \triangleq *Remind* \wedge *Success*

RFindBirthday \triangleq $(\textit{FindBirthday} \wedge \textit{Success}) \vee \textit{NotKnown}$

16. Upload your lab sheet with commented properties and explanations into Kalam. Only file Lab_1_<your ID>.zed8 is needed.

Please note, your lab is a subject for plagiarism checking. Most important are showing your understanding and *unique* comments inside developed Z specification.
